This method involves C transferring the human DNA into a cell line (pref. rat Rama 37) C into a syngeneic animal, injecting the transformed cells into a C syngeneic animal, selecting those animals having metastasing C tumours, and recovering the Met-DNA (see also T72785-90) from them. C The human DNA is tagged to assist in its removal or insertion from C problem of identifying the inserted human DNA sequences in the rat C genome of the transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Ma

                      The invention provides isolated Toxoplasma gondii nucleic acids that encode immunogenic polypeptides. The T. gondii nucleic acid molecules, immunogenic proteins and antibodies to the proteins can be used to inhibit T. gondii oocyst shedding in a cat due to infection with T. gondii. They can be used for preventing T. gondii infection and for preventing the spread of T. gondii infection. They can also be used for detecting T. gondii infection. The detection method can be used to detect parasite cysts or oocysts in feces, e.g. from enteric apicomplexa oocysts such as Cryptosporidium oocysts and Toxoplasma oocysts.
                                                                                                                                                                                                                                                                                                                                                                                                                            Toxoplasma

The recombinant ies can be used for diagnosis and/or therapy, while the avoids the need for intermediate separation of light and nains and gene library screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This represents the DNA sequence of the SLDH gene encoding a protein with sorbitol dehydrogenase (SLDH) activity. The DNA also encodes an open reading frame (ORF2) product upstream of the SLDH open reading frame, needed for SLDH activity in vivo. Host cells transformed by a vector comprising the SLDH DNA sequence are used for the recombinant expression of the sorbitol dehydrogenase. Recombinant D-sorbitol dehydrogenase is useful for producing L-sorbose from D-sorbitol. L-sorbose is an important intermediate in vitamin C production.

                                                                                                      invention relates to a method of detecting and characterising a stealth virus by reacting a sample suspected of containing a stealth virus with a robe from a known stealth virus and sequencing the resultant isolated nucleotide. The method comprises the steps of: (a) isolating DNA or RNA cells showing a viral cytopathic effect; (b) testing the reactivity of the isolated DNA or RNA with a molecular probe that contains at least 18 cor more contiguous nucleotides identical to sequence previously identified from a stealth virus; and, optionally (c) sequencing the isolated DNA or RNA molecules that react with the probe. The method is clearly contained to detect stealth virus in a biological product, food or in the movironment. The method is also used to evaluate agents for their inhibitory or stimulatory effects on stealth virus replication and to determine capacity of the virus to recombine with and potentially alter the nucleic acid sequences of a cell or bacterium.

                                                                                                             51
Z29251
                                                                                                                                                                                                                                                                                                          Nested oligonucleotide primers were synthesised which were complementary to the lambda DNA sequence adjacent to the cloning site for the cDNA insertions (see Q70113-14). In addition, primers were designed which were complementary to the plus strand of the most 5' region of the EK coding sequence (see Q70115-16). Subcloning and sequencing provided a 116 amino acid EK heavy chain. This protein contained regions corresp. to tryptic peptides (see R57295-9).
                                                                                                                                                                                                                                                                                                                                                                                                                                       proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid encoding enterokinase activity - and related vectors, host cells, expression products and antibodies are useful in treating digestive disorders and for cleaving fusion

Oligonucleotide primers were used to amplify each selected ORF from chromosome 2 using genomic DNA as template. The purified amplified products were cloned into the mammalian expression plasmid VR1050 to produce DNA vaccines for immunisation. Blood and sera obtained from groups of mice immunised with doses of vaccine was used to identify stage specific expression of Rifin protein by immunofluorescent antibody testing. The method is useful for determination of subcellular localisation of proteins and for the development of antimicrobial

Also claimed is a peptide sequence that consists of a 5-40 AA residue sequence that corresponds to a sequence of the 540 AA residue protein (P81351) or the 517 AA residue protein (P81868) coded for by the DNA sequence. The proteins can be used for determining previous immunological exposure of a mammal to M.tuberculosis or M.bovis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant mycobacterial peptide(s) - used in assays for diagnosis of infection, vaccines and for producing antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          24-FEB-1988;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This DNA sequence encodes the 65 kDa heat shock protein (see C W44702), designated Mt Hsp65, of Mycobacterium tuberculosis. This protein cross-reacts with a component of articular cartilage, human the component of articular cartilage, human collaboration in a claimed method for treating or preventing an autoimmune disease in a mammal comprises: (a) providing a particle coated with an antigen cagainst which an immune response is mounted in the autoimmune response is construct components in the recipient cell of the construct components of the components of a reduction in a cottocoxic and construct components of a coding sequence for the contigen, operably linked to control elements such that the coding sequence can be transcribed and translated in a recipient cell, and cellivering the construct to the recipient cell using a gene gun. The antigen of step (a) is selected from collagen, Mt Hsp65, myelin basic protein, myelin oligodendrocyte glycoprotein, cytotoxic responses and elicit antigen desensitisation. The method is used especially for treating rheumatoid arthritis or multiple sclerosis. It represents a novel use for the known Mt Hsp65 gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  enhance neurite outgrowth from damaged neurons. The polypeptides can also be used as immunogens, reagents for isolating other semaphorins, or as reagents for screening chemical libraries for lead pharmaceutical agents. The nucleic acids can also be used as probes and primers for diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast
